Application Instructions for Lee Silsby Stabilized Glutathione Transdermal Gel

1. Remove the blue cap from the tip of the amber syringe containing the Glutathione gel.

2. Squirt the instructed amount of gel onto thin-skinned areas of the patient's body such as the tops of feet, thighs (from the knee directly up, not the inner thigh), ankles, shins, inner forearm or lower back. **Do not yet rub in until the steps below are completed.**

3. Next, remove the small cap from the top of the jar labeled **IPM Cream for Glutathione.**

4. Using your thumb, push up from the bottom of the jar until an amount approximately equal to the Glutathione gel is squeezed out of the top of the jar. Apply on top of, or directly next to, the Glutathione gel.

5. Wearing a glove or finger cot, rub and mix both cream and gel together. Latex gloves are fine to use as long as your child does not have a sensitivity to latex. If such a sensitivity does exist, please use Nitrile gloves, which are latex-free.

6. If possible, rotate the site of application each time the Glutathione gel is applied.
